

Thank you for your January 31, 2017, presentation about focusing strategically on certain radionuclides of concern. For most of the Shipyard, we support this approach. In some specific areas where particular radionuclides of concern other than Ra-226 and Cs-137 have been measured, please include those in the statistical analyses. Here are examples:

1. Sr-90 and Cs-137 in Parcel E 500 series buildings area where NRDL operations occurred
2. Sr-90 in luminescent deck markers landfill in Parcel E-2
3. Sr-90, Cs-137, and Pu-239 in a vault together in the Parcel E 500 series area
4. Europium in Gun Mole Pier in Parcel D-1 [Did Shaw do this work? If so, then should we take this off the list?]
5. Co-60 in Parcel E-2 Shipshielding area [Or do we not worry about this bc half life is 5 yrs?]
6. Th-232 under Building 134 in Parcel B
7. Am-241 under Building
